

Release information for SilviA 7 version 2018.2

This document describes new features in SilviA release 2018.2.

2018.2.0.5

The following bugs have been fixed:

Ticket	Customer	Description
#63069	All	Remove C1Zip-usage
#63143	All	Mom-files with version 3.3. aren't correctly loaded
#63140	All	The simulation could select the wrong bark reduction depending on how stm files are chosen

2018.2.0.4

Enhancements

Logging forms

The StanForD-group has decided on a number of default logging forms in StanForD2010. These definitions are now implemented in SilviA and can be viewed and changed in settings. The logging form can be set in the OIN and will then be shown in other files with objectdefinitions.

Stemcodes

SilviA now supports stem codes in StanForD 2010 (version 3.x). Stem codes are to be used to define special properties on certain stems, for example high stump or seed tree.

Combine HPR-files

Several HPR-files can now be combined to a single file for easier follow up. The files need to be from the same version. If files from several machines are combined, the individual machines species and products will be used for those machines productions.

License handling for server installations

License handling for certain types of server installations has been simplified. Contact support for more information.
